

## **How attentional processes during encoding of a traumatic event may affect the way a trauma is remembered and re-encoded, and how this is associated with intrusions in PTSD**

A masters thesis in the following project is possible: the project investigates how attentional processes during encoding of a traumatic event may affect the way a trauma is remembered and re-encoded, and how this is associated with intrusions in PTSD. This will be investigated via eye tracking and event sampling methods. You will be part of the project team and may be involved in all project phases. English language knowledge is a requirement.
